Executive Summary

TradeStation is committed to **streamlining onboarding, delivering a unified trading experience, and providing best in class complex options workflows**. TradeStation HUB will integrate the most frequently used trading components (watchlists, charts, options chains, fundamental data, and news) to deliver a cohesive experience from the very first interaction.

By guiding new clients through **watchlist setup** (synchronized across mobile, TITAN X, and now HUB), we create an immediate sense of personalization and readiness across platforms. Pairing this with a Getting Started Checklist will help users adopt key platform features and streamline getting to first trade.

The **Symbol Detail** View within HUB **unifies the experience across platforms** by providing a complete trading workflow around active positions with tightly integrated **symbol detail, chart, and options trading capabilities**.

With the addition of Options Chain into the Symbol Detail workflow, we will also need to complete option grouping workflows by adding **Custom Grouping – FlexView** to the Positions in HUB. This is an important step to ensure **parity across platforms** and that HUB fully supports options workflows – trade and post trade.

HUB's Symbol Detail is designed as an integrated extension of portfolio management—not a replacement for TITAN X or a separate active trading application. Users navigate naturally from their Dashboard and Positions views into Symbol Detail to analyze and trade specific holdings or watchlist symbols, then return seamlessly to their portfolio context. This "portfolio-first" approach ensures HUB serves quick-analysis, position-management, and opportunistic trading workflows while maintaining persistent awareness of overall account performance and holdings. Portfolio **Dashboard -> Positions -> Symbol Detail -> Trade -> Orders/Positions**

For intensive intraday trading and multi-workspace setups, TITAN X remains the professional-grade solution, while HUB provides the browser-based convenience traders need for daily portfolio management and rapid execution.

HUB will provide launch points for advanced features in TITAN X and Mobile – driving users toward our active trader platforms.

Introduction / Background

- **Problem(s)**

Fragmented trading workflows and inconsistent parity across platforms. Active traders need a consistent experience managing positions and orders across platforms. HUB does not currently provide critical workflow components available in TITAN X and Mobile that enable fast analysis-to-execution and coherent post-trade management.

- **Why does this problem exist?**

Product-suite expansion & tech-debt – Desktop, Web Trading, and Titan Desktop have each developed in isolation, resulting in three separate UI design systems and distinct user experiences.

- **Benefit from solving this problem.**

Increased Activation – Integrating Watchlist into the Trade Ready checklist is the first step to providing cross-platform personalization and consistency. It provides a launch-point to “Now view your Watchlist in Mobile or Titan” and drives users toward downloading and logging into our active trader platforms – getting them closer to their first trade.

Retention of high-value segments – Our focus is on active equity & option traders. Providing full position management around equities and options at each touchpoint - gives them the tools they need for quick execution – driving increased customer satisfaction and retention.

Increased Options Trading– Integration of the Options Chain in Symbol View and Custom Grouping in Positions provide traders with the critical tools they need to manage position and portfolio risk and capture profits.

- **Why should we solve this problem now?**

We have recently introduced HUB portfolio and positions features with trading functionality; the absence of symbol views, charting, options chain, and options grouping would leave the platform lacking and not fully address the requirements of our main user groups. Positions in Mobile may not reflect the same in Titan, users are not able to manage multi-leg options positions efficiently, and we are missing activation pathways by not having Watchlist in HUB.

Assumptions

- DXCharts capability: DXCharts is expected to cover every charting capability, study, overlay, and performance target that Titan offers today.
- HUB performance: The existing React shell can handle three heavy sub-tabs (Overview, Chart, Options Chain) performance degradation.
- Amplitude taxonomy readiness: Amplitude taxonomy will be ready to go, so we can instrument activation events from day one

Benefits

Financial Benefits

Non-Financial Benefits

Contributions to TSG-287 Goals

Supports the following TSG goals

- Increase the rate for "first trade within 15 days" by 2% within the first year
- Reduce the ratio of clients that fund and never trade by 5% within the first year
- HVC retention increased by 2% (80%-82%)

Improve customer's ability to place a first trade through the following:

- Checklist provides users with guidance toward activation by personalizing the platform and driving downloads/logins of our active trader platforms:
 - Increase number of users with first login on Mobile during first 15 days post funding - by 15% over the next 6 month period
 - Increase number of users with first login on Titan during first 15 days post funding - by 15% over the next 6 month period

Increase High Value Customer Retention

- HVCs who are active on all 3 platforms have increased retention rates vs those who do not

Secondary metrics

- HVCs who place trades on HUB have an increased retention rate vs those who do not.
- HVCs who use Symbol Detail have an increased retention rate vs those who do not.

Scope

In-Scope: High-Level Deliverables

Getting Started / Trading Essentials

Symbol Detail, Options Grouping Flex View, Watchlist - Enhanced Dashboard

- **Symbol Detail**

The Symbol Detail module delivers tightly integrated components to support
MONITORING --> ANALYZING --> TRADING

- **Charting** – DXCharts-powered streaming charts with full indicator and drawing object parity to TITAN X (and eventually mobile). Includes chart trading and an advanced, consistent order ticket for seamless order entry.
- **Overview** – Comprehensive market context with fundamental data, news, earnings, analyst sentiment, and account-level position details—all in one view.
- **Options Chain** – A robust multi-leg strategy builder featuring strike-to-ticket linking, Greeks and IV metrics, and synchronized position highlighting
- **Trade ticket** – An existing capability that will need to be linked to the other sections of symbol detail to complete the workflow

Integration Philosophy: Portfolio-Centric, Not Standalone Platform

Key Design Principle: Symbol Detail is architecturally integrated into HUB's portfolio workflow rather than functioning as an isolated trading terminal.

Navigation Model:

Entry Points - Users access Symbol Detail by clicking symbols from:

- Dashboard watchlist widgets
- Positions page (held symbols)
- Orders page (symbols with active orders)
- Search/symbol lookup

Context Retention: When users navigate to Symbol Detail, they maintain persistent access to:

- Top navigation: Quick links back to Dashboard, Positions, Orders, Balances - Account summary bar: Real-time buying power and portfolio P&L remain visible

- Position indicators: Any existing position in the symbol is highlighted in Overview

Workflow Completion: After placing an order or completing analysis, users naturally return to:

- Positions or Orders page (to monitor filled orders)
- Dashboard (to see portfolio-level impact)
- Watchlist (to analyze next symbol)

What Symbol Detail IS: A deep-dive view for analyzing and trading specific symbols within portfolio context

- An integrated component of account/position management workflow
- A browser-based alternative for traders who prefer web access over desktop apps
- A "quick-execution" environment for opportunistic trades on held or watchlist symbols

What Symbol Detail IS NOT:

- A multi-workspace professional trading platform
- A standalone "day trading terminal" with Level 2, Matrix, or multi-chart layouts
- A full-featured active-trading platform (those workflows remain in TITAN X)

- Custom Grouping-Flex View

With the addition of OptionsChain into the Symbol Detail workflow, we will also need to complete option grouping workflows by adding Custom Grouping – FlexView to the Positions in HUB. This is an important step to ensure parity across platforms and that HUB is an integral part of the customer workflow that enables pre-to-post trade workflows around options.

- **Watchlist / Hotlists** – Adding the Watchlist to the Dashboard will provide platform customization out of the funding gate. Synchronized quote lists across TITAN X, mobile, and HUB. Includes dynamic hotlists for quick access to top-moving assets, giving users an immediate path to getting set up on TradeStation and driving activation through platform customization and downloads of TITAN X & Mobile. The Watchlist/Hotlist will also be an expandable component under the Symbol Detail to enable users to research what the symbols they follow
- **Dashboard**
Watchlists/Hotlists will be displayed on the HUB Dashboard—a personalized account landing page tailored to the onboarding stage. It will be the funnel that drives users toward their next trade.

Pre-Funding:

The Dashboard features clear steps to complete onboarding (funding, market data selection, and learning) – maintaining focus on funding and activation.

Post-Funding:

The Dashboard will evolve to display a watchlist next to account summaries, positions, performance attribution, news, events, and market benchmarks—answering the key question: “What’s happening in the market and how is it affecting my portfolio?”

A Getting Started Checklist will be added to the top of the page to help drive users toward platform personalization through configuring their first Watchlist. It will also provide direct links to access our active trading platforms Mobile and HUB. Additional details in Appendix: [Post Funding Checklist - detail requirements.docx](#)

Every component will be actionable, guiding users to deeper portfolio views or directly to Symbol Overview and Trade Ticket for immediate execution.

A merged Dashboard / Portfolio Overview will be the new landing page for HUB and contain all pertinent information and supporting processes related to customer onboarding and maintenance for first accounts, additional accounts, and document uploads. This will further anchor HUB as a portfolio-centric capability.

- Overhaul Amplitude Event Taxonomy

Fully remove and replace the original event taxonomy within HUB, as established from the initial launch of HUB, in order to bring HUB into compliance with the new taxonomy to be defined and managed in Airtable by PM. The new taxonomy seeks to enhance our tracking and contrasting capabilities by applying the same approach to event, event property, and user property structure across all of our platforms.

Out-of-Scope: Exclusions

HUB is not an active trading platform – therefore the following active trader workflows/components are not included in the scope of this initiative. However, HUB will enable linking out these advanced features in TITAN X and Mobile – driving users toward our active trader platforms.

- Level 2 / Market Depth
- Matrix
- Options Visualizations and Strategy Analyzer
- Mobile first responsiveness: If users are on small screen mobile devices, we will drive to mobile app – Launch in TS Mobile
- Multiple Charts
- Automation / Easy Language
- Radar Scanner
- Risk/Reward Graphs.

Departments Impacted/Involved

<Identify all the departments that may be impacted or involved in the project. Please see Stakeholder Matrix for more details. Groups needed for BRD Sign off will be handled as a Decision in the RAID. Add any additional groups to the below table if needed>

Name of Department	Area	Impacted/Involved (Yes / No)
Marketing	Marketing	Yes
Sales	Inside Sales	No
	Intuitional Sales	No
	International / TSIL/ TSEU	No
Customer Experience	CE Support	Yes

Business Requirements

External Customer Requirements

1. Active Equity Day-Trader & Swing Trader

Role description – Trades equities intraday or holds few days. Uses HUB for portfolio monitoring and quick opportunistic trades on held positions or watchlist symbols. For intensive multi-chart day trading, uses TITAN X.

Requirements

- Navigate from Positions or Dashboard watchlist directly into Symbol Detail with one click
- View existing position details (quantity, average cost, P&L) in Overview tab while reviewing the chart
- Launch market, limit, stop, or trailing-stop ticket directly from the chart
- Place OCO/OSO orders without leaving Symbol Detail; see bracket legs plotted visually
- Quickly toggle through symbols in watchlist without losing portfolio context
- Return to Positions or Dashboard via persistent top navigation
- View account buying power and total portfolio P&L while in Symbol Detail

Rationale: Maintains portfolio-first workflow while providing chart-to-ticket execution speed.

Distinguishes HUB (portfolio + opportunistic trading) from TITAN X (professional active trading).

2. Options Swing-Trader

Role description: Builds multi-day option positions (verticals, butterflies, condors) and monitors Greeks. Uses HUB to analyze symbols from their watchlist or existing positions, build strategies, and execute trades without leaving their browser.

Requirements

- Navigate from the Positions page to Symbol Detail to analyze existing option positions.
- View existing positions highlighted in the Options Chain with real-time P&L.
- Open a strategy dropdown on the chain and auto-populate a multi-leg ticket.
- Display delta, theta, and IV% for every strike with sortable columns.
- Sync the chart to the selected strike or expiry when building a strategy.
- Review aggregate position Greeks across all held contracts before adding new positions.
- Close out from Symbol Detail and return to Positions with Custom Grouping to see updated portfolio Greeks.

Rationale – Enables complex strategy construction within portfolio context, ensuring traders see how new positions affect overall portfolio risk before committing capital.

Internal TradeStation Requirements

1. Marketing

- o All TradeStation website assets updated
- o Email push announcing new launch of new features
- o All necessary events created in Amplitude to run targeted campaigns

- o Banner in hub announcing release
- 2. **Customer Learning**
 - o 2-minute explainer video
 - o Knowledge-base articles for all new features
 - o Education center updated
- 3. **Sales (Inside-Sales & Institutional)**
 - o Provide platform demo webinar and be available to answer any questions about the upcoming release, feature set, and value to end users.
- 4. **Customer Support (Customer Experience, Concierge, Trade Desk)**
 - o Must be informed about new features and feature changes to be able help troubleshoot user issues.
 - o Provide platform demo webinar and be available to answer any questions about the upcoming release, feature set, and value to end users.
 - o Open PM <> Support Channel for communication during launch
- 5. **Product Operations**
 - o Needs to be aware of key dates and launch plans.
- 6. **Product Management & Product Data Insights**
 - o Define and review Amplitude taxonomy for all features (new and pre-existing) in **Airtable** inclusive of events, event properties, and desired user properties.
 - o Configure Amplitude taxonomy for all features (new and pre-existing) in **Amplitude** inclusive of events, event properties, and desired user properties.
 - o Instrumented Amplitude taxonomy for all features (new and pre-existing) is fully testable from client application through to Amplitude (reporting) inclusive of all events, event properties, and desired user properties.
 - o Statuses of event taxonomy components in Airtable are maintained according to our documented process to ensure concise and shared awareness of current readiness.
- 7. **Product Data Insights & BI Team**
 - o Event data available in Amplitude, Sigma, Databricks in near real time.
 - o Default dashboards: adoption, grouped-view trade lift, error rates.
- 8. **Legal / Compliance**
 - o Must setup periodic meetings to review component features.
 - o Provide required feature screenshot submitted through RedOak
 - o Be available host webinar explain feature launch and answer UI questions.
- 9. **Executives**
 - o Need quarterly KPI packet showing adoption and other key metrics
 - o Provide timely updates: post launch email updates

Acceptance / Success Criteria

1. **Overview Tab**
 - a. Market Snapshot: Given a supported symbol and available real-time data, when the user opens the symbol view, then a snapshot shows Last Price, Bid, Ask, Day % Change, and Volume updating in near real time.

- b. Position Card: Given the user holds a position in the symbol, when the position card renders, then it displays Quantity and real-time P/L calculated from average cost and current price; otherwise it shows a clear “No position” state.
- c. Fundamentals Panel: Given fundamentals are available, when the panel renders, then it shows Market Cap, EPS, Dividend, Beta, and Float with standard units and “N/A” for missing values.
- d. News & Corporate Actions Feed: Given recent items exist, when the feed renders, then it lists news and corporate actions in reverse chronological order with source and timestamp, and each opens via link-out; otherwise an empty state appears.
- e. Earnings Calendar & Analyst-Rating Widget: Given provider data exists, when the widgets render, then the earnings calendar shows upcoming (and most recent) dates and the analyst-rating shows consensus with coverage details, reflecting the latest data on page load.

2. Charts

- a. DXCharts Intraday Streaming: Given live market data is available, when intraday candles are produced, then DXCharts streams and renders each new candle with near-real-time latency and without missing bars.
- b. Studies/Overlays Selectable: Given Titan’s catalog of studies/overlays, when a user selects any study or overlay in DXCharts, then it is selectable with default parameters and renders correctly on the chart.
- c. Studies saved to default display - should persist across symbol changes and sessions.
- d. Advanced Orders from Chart: Given an instrument is displayed, when the user invokes chart trading, then they can configure and submit advanced orders directly from the chart with correct price anchoring and validation.
- e. Single/Multi-Pane with Intervals: Given a supported symbol, when the user selects studies and interval options, then DXCharts displays single-pane or multi-pane charts with intervals and studies as chosen. (Multi-pane refers to the additional panes that are added when adding a technical study/indicator - not multiple chart components)
- f. Full Titan Library at Launch: When DXCharts loads, then the full library of Titan studies/overlays is present, discoverable, and usable without omissions.
- g. Position View: Given the user holds a position in the symbol, when the position view renders, then it displays Quantity and real-time P/L calculated from average cost and current price; otherwise it shows a clear “No position” state.
- h. Order Placement from Chart: Given a supported instrument and user account, when the user invokes chart trading, then the system allows configuration and submission of orders directly from the chart, with price anchoring and validation that matches the chart view.

- i. Order Visualization: When an order is placed via chart trading, then the order appears visually on the chart at the anchored price, including order type, quantity, and status indicator, updating in near real time.

3. Options Chain

- a. Chain Performance: Given normal network/server conditions, when the user loads the options chain or scrolls within it, then the interaction completes in ≤ 2.0 seconds at p95.
- b. Strategy Preset Multi-Leg: Given the strategy preset and a user selected option strategy, when the user opens the order ticket, then the order is pre-populated correctly with the correct prices, leg quantity, and direction (buy/sell)
- c. Greeks & IV Parity: Given greeks and IV data are available, when Delta, Gamma, Theta, Vega, and IV% columns render, then their values match Titan Desktop for the same symbol and snapshot.
- d. Held Position Highlight : Given the user holds positions in the underlying or options, when the chain renders the position is highlighted
- e. Given a user selects an options strategy from the options chain, when the trade ticket is opened, then the strategy type, legs, and corresponding parameters (such as strikes, quantity, and direction) are pre-populated accurately in the ticket.
- f. When the user edits the strategy or its legs in the options chain, then those changes are immediately reflected in the trade ticket upon opening, ensuring consistency between the chain and ticket configuration
- g. Calls/Puts/Strategy/Strike Count Controls: Given chain controls are present, when the user toggles calls vs puts, selects a strategy from the dropdown, or changes the number of strikes to display, then the chain updates immediately to reflect the chosen settings.
- h. Column Set Presence: Given the configured column set, when the chain renders, then top-of-book, greeks, and market statistics columns are present and display correctly formatted, up-to-date values. User column settings should remain persistent across sessions.
- i. Position View: Given the user holds a position in the symbol or options, when the position view renders, then it displays Quantity and real-time P/L calculated from average cost and current price; otherwise it shows a clear “No position” state.

4. Cross-Module

- a. Context Retention: Given a symbol is selected and an order ticket is open, when the user switches between Overview, Chart, and Options, then the symbol context and the open order-ticket state persist without reset.

- b. Multi-Component Page Composition: Given the multi-component page is loaded, when it renders, then charts, watchlist, positions/ orders, and the order ticket appear together with correct data and stable layout.
 - c. When Trade Ticket is expanded, it should remain open until the user closes it or a new session is created. Users within the same session should be able to change symbols, leave the page, return, and the Trade Ticket be in the same state as the previous instance (open or closed).
 - d. The Account Selection at the top-level should remain persistent during the session when navigating symbols and sections. The Trade Ticket should remain synced to the top-level selection unless changed specifically by the user when placing a trade.
5. **Options Custom Grouping added to Positions**
- a. Custom Grouping in HUB Positions: Given positions data is loaded, when the user creates or selects a custom grouping, then the HUB Positions view displays positions grouped accordingly with consistent labels and ordering.
 - b. Parity with Mobile Flex-View: Given Mobile support Custom Grouping Flex-View, when the same account/symbol context is viewed in HUB, then the grouping presentation (layout, labels, sort behavior, expand/collapse) matches Mobile.
 - c. Grouping Persistence Across Sessions: Given a user has configured custom groupings, when they sign out, reload, or return on another device, then those groupings persist across sessions under the same account.
 - d. Cross-Platform Grouping Sync: Given custom groupings exist in Mobile for the account, when HUB loads Positions, then those groupings are fetched and displayed in HUB without manual reconfiguration.
6. **Responsive Layout**
- a. Desktop & Tablet Breakpoints: Given viewport width ≥ 1024 px (desktop) or 768–1023 px (tablet), when the app renders, then the corresponding responsive layout applies with full feature support and stable component arrangement.
 - b. Limited Mobile-Web Support: Given viewport width < 768 px on mobile web, when the app renders, then core read-only views and basic navigation load while advanced trading/chart features are disabled or redirected to Mobile and/or Titan
7. **Dashboard**
- a. Account State Configuration: Given the customer's account state (pre-funding or post-funding) is known, when the app renders, then component configuration adjusts to the appropriate state-specific layout and content.
 - b. Pre-Funding Dashboard: Given the account is pre-funding, when the dashboard loads, then it displays key components and tasks that facilitate funding completion and account activation.

- c. Post-Funding Dashboard: Given the account is funded, when the dashboard loads, then it displays key account/portfolio components along with the Watchlist and Getting Started Checklist if there are open items to be completed.
- d. Dashboard should retain all Trade Ready Checklist and Document Upload functionality in the current dashboard. It should support all existing account states and conditions including but not limited to those outlined in the Appendix document: [Dashboard - Portfolio Overview states.docx](#) Additional details covering MBI specific implementation details for this section will be completed by the time the MBI is ready for analysis.
- e. Overview state
 - i. Market Snapshot: show market changes, hotlists, trending symbols.
 - ii. Fundamentals Panel: Given fundamentals are available, when the panel renders, then it shows Market Cap, EPS, Dividend, Beta, and Float with standard units and “N/A” for missing values.
 - iii. News & Corporate Actions Feed: Given recent items exist, when the feed renders, then it lists news and corporate actions in reverse chronological order with source and timestamp, and each opens via link-out; otherwise an empty state appears.

8. Checklist

- a. Mobile Download: Given the Mobile Download tile is visible, when the user clicks it, then HUB opens a direct link to the TradeStation Mobile install/login destination (not a generic platforms page).
- b. Titan Download: Given the Titan X download tile is visible, when the user clicks it, then HUB opens a direct link to Titan X download/setup (not a generic platforms page).
- c. Educational / Feature Video: Given the Educational / Feature Video tile is visible, when the user clicks it, then the video opens in an in-app modal or via a KB link with clear labeling and playback controls; the tile tracks start/complete state.
- d. Post Symbol Detail & Watchlist: Given the Symbol Detail tile is visible, when the user clicks it, then HUB navigates to Symbol Detail with the current Watchlist context retained (symbol selection and account bar visible).
- e. Create Watchlist: Given watchlist capability is available, when the user selects Create Watchlist, then HUB initiates the watchlist creation flow and marks the tile as Completed upon success.
- f. Upon completion of creating a watchlist in HUB, the user should receive a notification in TITAN X and Mobile that their watchlist is synced and have a link/tour to access.
- g. Access Chart Trading and Multileg Options views next: Given Chart Trading or Multileg Options are accessible, when the user selects the tile, then HUB links directly into those experiences; if the feature is not supported in HUB, provide launch points to Titan X or Mobile as advanced workflows.

9. Watchlist

- a. Given the watchlist is created in HUB, when the user navigates away and returns, then the watchlist remains available.
- b. Given a user creates or updates a watchlist in HUB, when the action is completed, then the watchlist and any changes are automatically synced and reflected in TITAN X and Mobile within a reasonable time (e.g., under 1 minute).
- c. Given a user modifies or deletes a watchlist on any platform (HUB, TITAN X, or Mobile), when the change is made, then the update is reflected across all platforms without manual refresh or reconfiguration.
- d. Given a user customizes columns or settings in a watchlist in HUB, when they sign out, reload, or access their account on another device, then those column choices and settings persist and are restored on next login.

10. Amplitude Event

- a. Amplitude taxonomy for all features (new and pre-existing) is fully implemented throughout all features and capabilities of the HUB as defined by PM in **Airtable** inclusive of all events, event properties, and desired user properties.
- b. Instrumented Amplitude taxonomy for all features (new and pre-existing) is fully tested and demonstratable from client application through to Amplitude (reporting) inclusive of all events, event properties, and desired user properties.
- c. Statuses of event taxonomy components in Airtable are maintained according to our documented process to ensure concise and shared awareness of current readiness.

11. Documentation & Enablement

- a. KB articles, onboarding video, and in-app guided tour for first-time visitors.

Dependencies

<Third Party, possibly outside companies, TSGs, MBIs, HW, etc.>

Supporting Documentation

[Dashboard Widget Priority.xlsx](#)

[Post Funding Checklist - detail requirements.docx](#)

[Sequencing / priority recommendations to be provided]

[Detailed document of design interactions to be provided]

Use Cases

1. Use Case Name: Create and Sync Watchlist Across Platforms

Primary Actor: Retail Trader (Newly Onboarded Client)

Secondary Actors: HUB, TITAN X, Mobile App

Objective: Enable the user to create a personalized watchlist that syncs across all platforms.

Context Scenario: A new client logs into HUB for the first time after funding their account. They want to monitor specific symbols and quickly access them across devices. HUB prompts them to create a watchlist and suggests hotlists for inspiration.

Desired Outcome: The user successfully creates a watchlist in HUB, which is immediately available in TITAN X and Mobile, reducing friction and improving engagement.

2. Use Case Name: Morning Portfolio Review → Opportunistic Trade Execution

Primary Actor: Active Trader (Existing Customer)

Secondary Actors: HUB Dashboard, Symbol Detail, Trade Ticket, Positions Page

Objective: Enable seamless workflow from portfolio monitoring to symbol analysis to trade execution, without leaving HUB or losing portfolio context.

Context Scenario: At 9:35 AM ET, an active trader logs into HUB and lands on the Dashboard. The dashboard displays:

- Account balance and buying power at the top
- Portfolio P&L widget showing +\$1,250 (+2.1%) for the day
- Performance attribution: AAPL position up \$800, TSLA up \$600, SPY down \$150
- Watchlist widget showing 10 symbols with real-time quotes
- News widget: "AAPL announces new product launch"

The trader notices AAPL is up 3.2% and contributing significantly to today's P&L. They click "AAPL" in the Performance Attribution widget.

Step-by-Step Flow:

1. HUB navigates to Symbol Detail (AAPL) with Overview tab active
2. Overview displays:
 - a. Market snapshot: AAPL \$185.50 (+3.2%, +\$5.75)
 - b. Position card: "You hold 100 shares at \$180.25 avg cost. P&L: +\$525 (+2.9%)"
 - c. Fundamentals: Market cap, P/E, upcoming earnings date
 - d. News feed: Product launch announcement article
3. Trader clicks "Chart" tab to review technical setup
4. Chart shows AAPL approaching previous resistance at \$186.00
5. Trader decides to take partial profit: sell 50 shares at market
6. Trader clicks price on chart → order ticket slides in from right
7. Order ticket pre-populates:
 - a. Symbol: AAPL
 - b. Action: SELL (since position exists)
 - c. Quantity: 50 (half of position)
 - d. Order Type: Market
8. Trader reviews: "Sell 50 AAPL at Market. Est. proceeds: ~\$9,275"
9. Trader clicks "Place Order" → confirmation modal
10. Order executes immediately (fills at \$185.48)
11. Post-trade confirmation: "Sold 50 AAPL at \$185.48. Your remaining position: 50 shares at \$180.25 avg. Realized P&L: +\$261.50"
12. Trader clicks "View Positions" in top nav
13. HUB navigates back to Positions page
14. Positions page shows updated:
 - a. AAPL: 50 shares (down from 100), avg cost \$180.25, current P&L +\$261.50
 - b. Updated portfolio P&L: +\$1,250 (unchanged, but now partially realized)

Desired Outcome: The trader successfully executed a profit-taking trade while maintaining full portfolio context throughout. The workflow felt like "drilling down" from portfolio → symbol detail → trade → back to portfolio, reinforcing HUB's role as an integrated platform rather than a standalone trading app. The trader feels confident in their decision because they saw both the technical setup (chart) and their existing position details (Overview) before committing.

Supports Business Goals:

- **Retention:** Seamless workflow keeps traders engaged in HUB ecosystem
- **CSAT:** Intuitive navigation and context retention improves satisfaction
- **Portfolio-first design:** Differentiates HUB from standalone trading platforms

3. **Use Case Name:** Analyze Symbol Using Integrated Charting

Primary Actor: Active Trader

Secondary Actors: HUB, DXCharts

Objective: Provide professional-grade charting and order entry directly in the browser.

Context Scenario: An active trader opens HUB to quickly analyze a symbol before placing a trade. They access the Symbol Detail view, load streaming charts, apply indicators, and use chart trading to execute an order without leaving the browser.

Desired Outcome: The trader completes analysis and executes a trade seamlessly within HUB, reducing Time-to-First-Trade and improving satisfaction.

4. Use Case Name: Build Multi-Leg Options Strategy

Primary Actor: Options Trader

Secondary Actors: HUB, Options Chain Module

Objective: Allow users to construct and execute complex options strategies in a browser-based environment.

Context Scenario: An options trader navigates to the Symbol Detail view in HUB, opens the Options Chain, selects a multi-leg strategy. They review Greeks and IV metrics before sending the order.

Desired Outcome: The trader successfully creates and submits a multi-leg options order with confidence, leveraging advanced analytics without needing TITAN X.

5. Use Case Name: Quick Fundamental Check Before Trading

Primary Actor: Active Trader

Secondary Actors: HUB, Symbol Overview

Objective: Provide a consolidated view of fundamentals, news, and sentiment for informed decision-making.

Context Scenario: A casual investor logs into HUB to check earnings dates and analyst sentiment for a stock before placing a trade. They access the Overview section in Symbol Detail, review key data, and decide whether to proceed.

Desired Outcome: The investor feels informed and confident, leading to higher engagement and trust in HUB as a reliable source.

Diagrams

User Flow Diagrams / Journeys

Navigation Model:

Entry Points - Users access Symbol Detail by clicking symbols from:

- Dashboard watchlist widgets
- Positions page (held symbols)
- Orders page (symbols with active orders)
- Search/symbol lookup

Context Retention: When users navigate to Symbol Detail, they maintain persistent access to:

- Top navigation: Quick links back to Dashboard, Positions, Orders, Balances - Account summary bar: Real-time buying power and portfolio P&L remain visible
- Position indicators: Any existing position in the symbol is highlighted in Overview

Workflow Completion: After placing an order or completing analysis, users naturally return to:

- Positions page (to monitor filled orders)
- Dashboard (to see portfolio-level impact)
- Watchlist (to analyze next symbol)

What Symbol Detail IS: A deep-dive view for analyzing and trading specific symbols within portfolio context

- An integrated component of account/position management workflow
- A browser-based alternative for traders who prefer web access over desktop apps
- A convenient environment for opportunistic trades on positions or watchlist symbols

Example User Journey:

1. User logs into HUB → lands on Portfolio Overview / Dashboard
2. Dashboard shows portfolio P&L and watchlist with AAPL up 3%
3. User clicks AAPL → navigates to Symbol Detail (Overview/Chart/Options)
4. User reviews position details, checks chart, places a sell-to-close order
5. User clicks "Positions" in top nav → returns to Positions page to monitor order
6. After fill, user returns to Dashboard to see updated portfolio performance This integration ensures Symbol Detail accelerates activation and drives trading activity while maintaining HUB's identity as a unified portfolio management platform.

This integration ensures Symbol Detail accelerates activation and drives trading activity while maintaining HUB's identity as a unified portfolio management platform.

HUB Workflow Diagram

The diagram below highlights entry points to Symbol View and ability to switch between Symbol View and Positions/Orders in Portfolio

Entry points to Symbol View:

- Watchlist on dashboard
- Search (Omni)
- Positions
- Orders
